creating a new app

A terminal window with a dark background and light text. The window title is "harsh@harsh-vivobook: ~/Desktop/Projects/Django projects/...". The terminal shows several HTTP GET requests for static files, a "Not Found" message for /favicon.ico, and the execution of Django management commands. The output indicates that the system check passed, but there are 18 unapplied migrations for the 'admin', 'auth', 'contenttypes', and 'sessions' apps. The Django development server is then started on port 8080.

Django

The diagram illustrates the structure of a Django project. It is titled "Django Project" and contains two main components: "my_site" and "my_app".

- my_site** (yellow box) contains three files: `settings.py`, `admin.py`, and `urls.py`.
- my_app** (purple box) contains two files: `views.py` and `urls.py`.

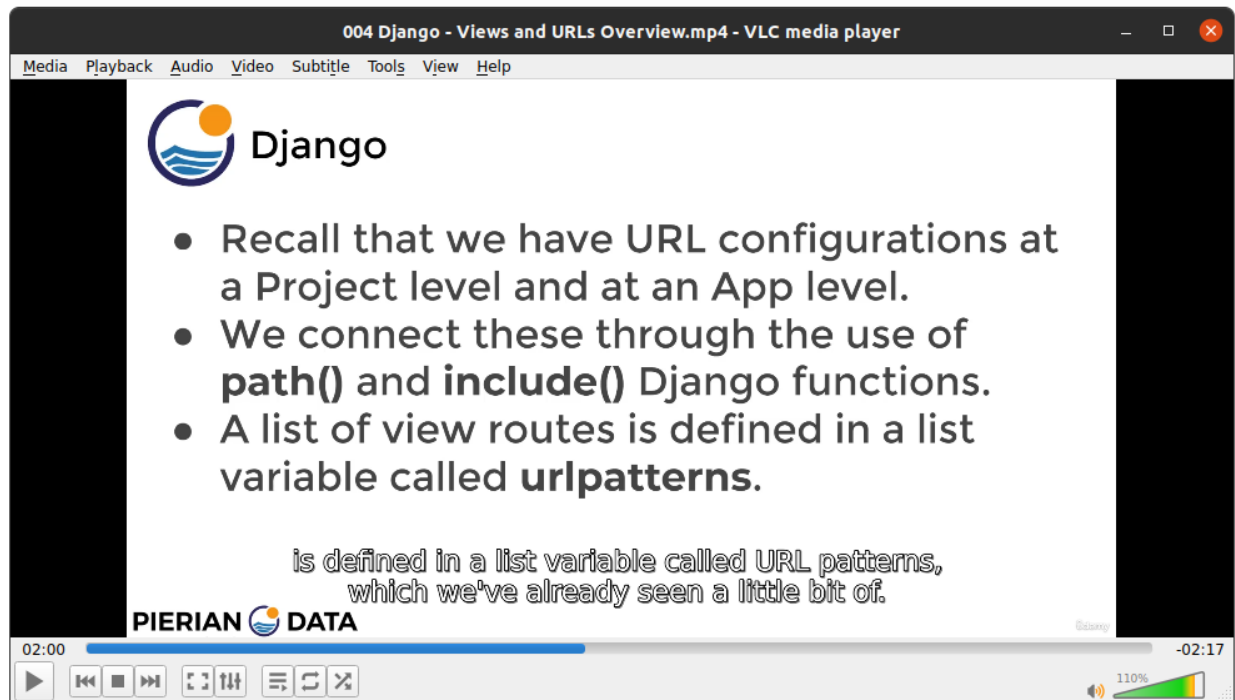

Arrows indicate dependencies: a red arrow points from `my_app.urls.py` to `my_site.urls.py`, and a red arrow points from `my_app.views.py` to `my_app.urls.py`.

So you often see something working like this or working like this when you have a larger project where

The Web Server Gateway Interface

(WSGI, pronounced whiskey or WIZ-ghee)

basically, **provides a standard interface between web applications written in Python and Webservers**

. That means, WSGI gives portability to your Python Web Application across many different Web Servers, without any additional configurations on your NGINX, Apache, etc.

- http request use ab use krna hai

The Asynchronous Server Gateway Interface (ASGI) is **a calling convention for web servers to forward requests to asynchronous-capable Python programming language frameworks, and applications**

. It is built as a successor to the Web Server Gateway Interface (WSGI).

- http request aur web sockets tab ye use krte hai

crating a new app and adding it to setting.py of main proj

The screenshot shows a Sublime Text editor window titled `~/Desktop/Projects/Django projects/p1/home/views.py (Django projects) - Sublime Text ...`. The interface includes a menu bar with `File`, `Edit`, `Selection`, `Find`, `View`, `Goto`, `Tools`, `Project`, `Preferences`, and `Help`. On the left, a **FOLDERS** sidebar displays the project structure:

- ▼ Django projects
 - ▼ p1
 - ▼ home
 - `__pycache__`
 - `migrations`
 - `/* __init__.py`
 - `/* admin.py`
 - `/* apps.py`
 - `/* models.py`
 - `/* tests.py`
 - `/* views.py`
 - ▼ p1
 - `__pycache__`
 - `/* __init__.py`
 - `/* asgi.py`
 - `/* settings.py`
 - `/* urls.py`
 - `/* wsgi.py`
 - `db.sqlite3`
 - `/* manage.py`

The main editor area has two tabs: `settings.py` and `views.py`. The `views.py` tab is active, showing the following Python code:

```
1 from django.shortcuts import render
2
3 from django.http import HttpResponse
4
5 # Create your views here.
6
7 def home(request):
8     return HttpResponse('Hey this is homepage')
```

The status bar at the bottom indicates `Line 8, Column 48`, `Tab Size: 4`, and `Python`.

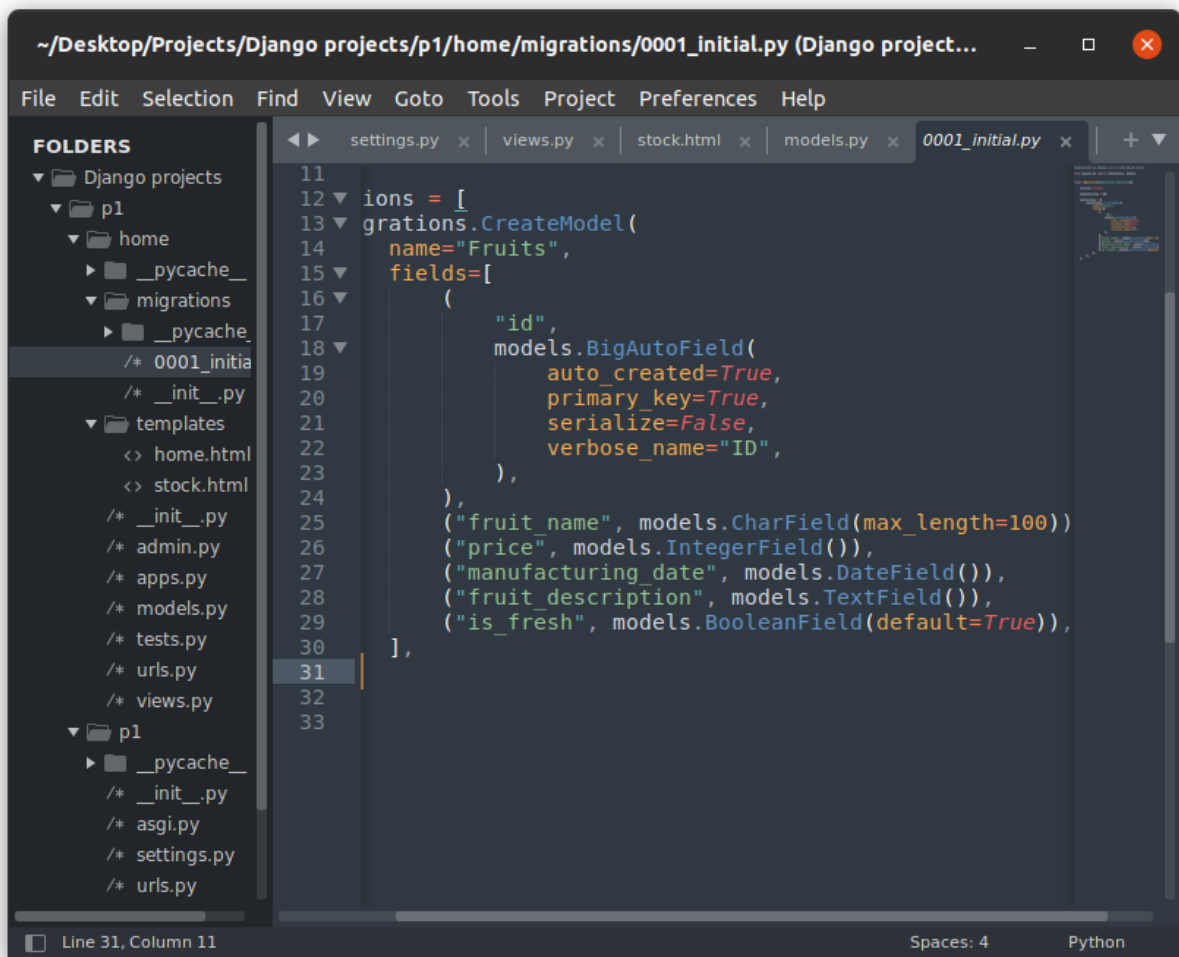

After adding the models we need to make migrations to save the changes

```
harsh@harsh-vivobook: ~/Desktop/Projects/Django projects/...
harsh@harsh-vivobook: ~/Desktop/Pr... x harsh@harsh-vivobook: ~/Desktop/Pr... x
, in Fruits
    is_fresh = models.BooleanField(default=True)
AttributeError: module 'django.db.models' has no attribute 'BooleanFiels'
/home/harsh/Desktop/Projects/Django projects/p1/home/models.py changed, reloading.

Quit the server with CONTROL-C.
```

as we can see we can't see our fruits table here because we need to register that model here first, in admin.py

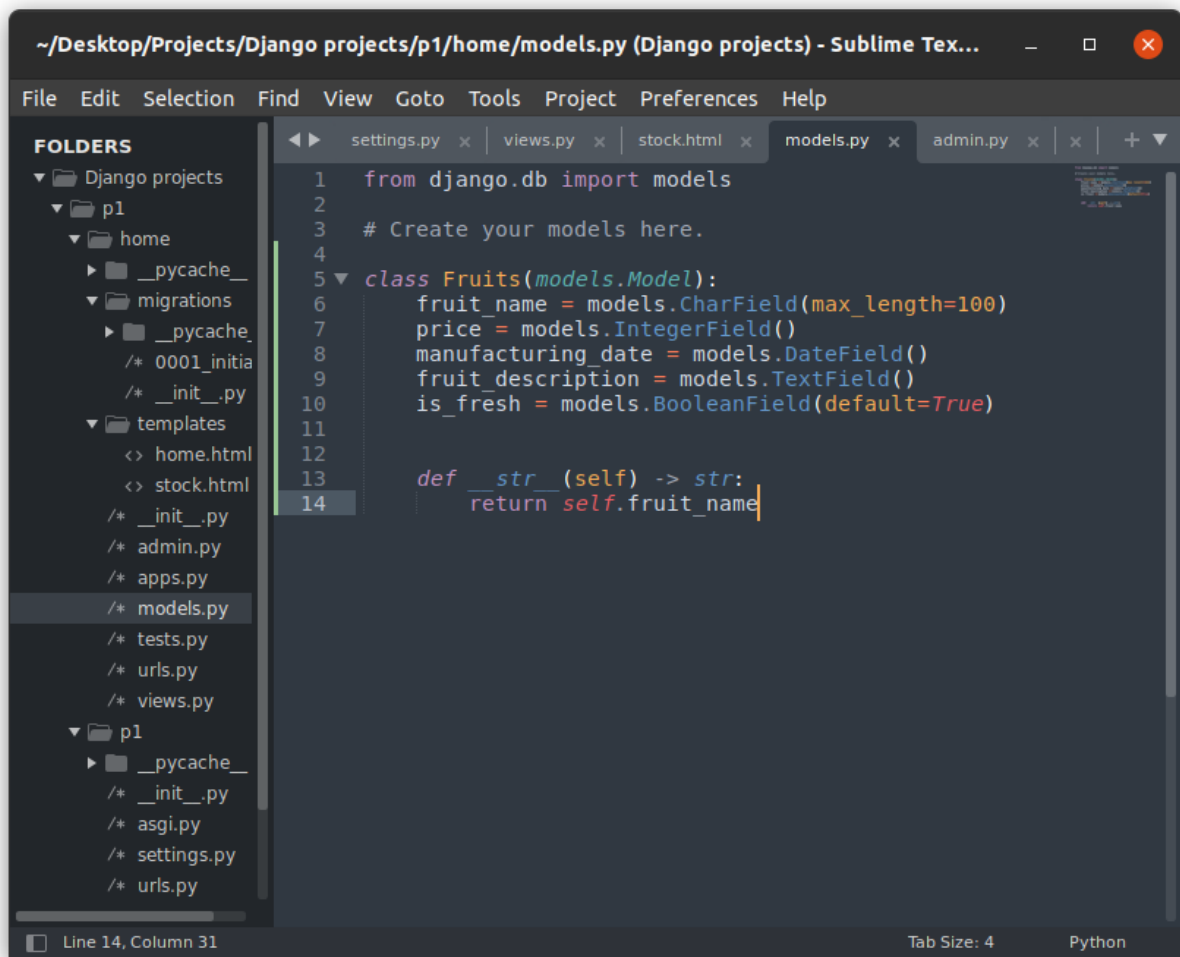

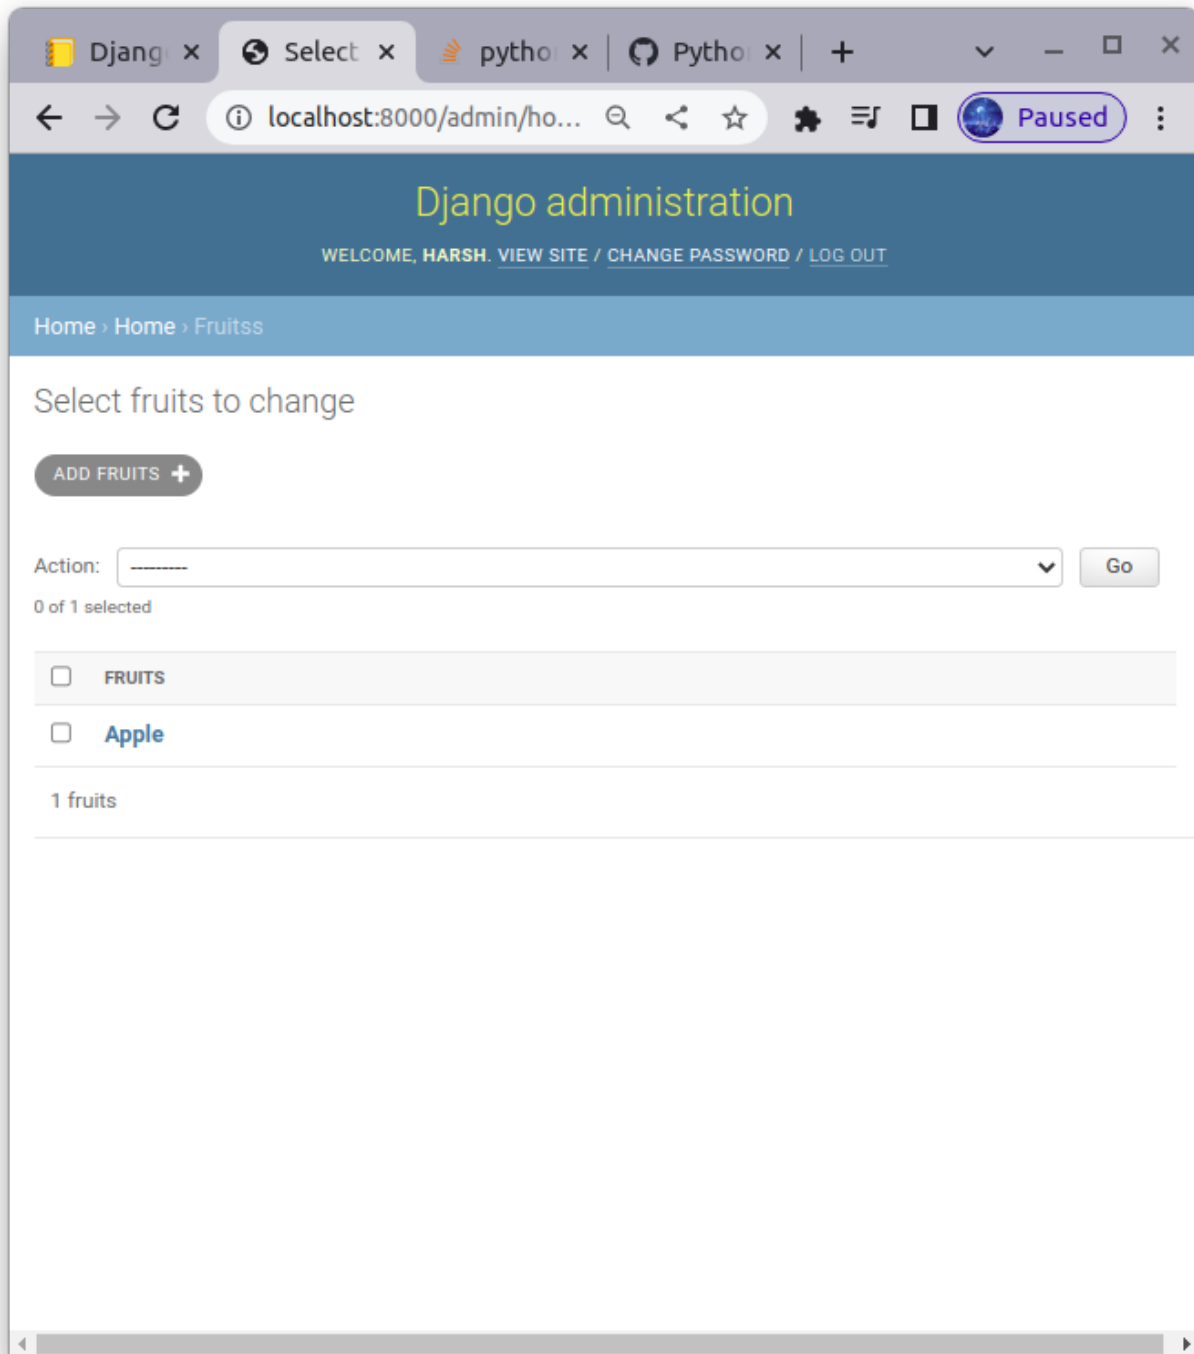

we can perform all the crud operations here

To make change that we should show fruit name instead of Fruits object in admin panel

- we need to make change in the models

If we want we can also add more things to it to show with the same label

~/Desktop/Projects/Django projects/p1/home/models.py (Django projects) - Sublime Text (UNREGISTERED)

Model Meta options | Django documentation | Django

To save you time, Django automatically derives the name of the database table from the name of your model class and the app that contains it. A model's database table name is constructed by joining the model's "app label" - the name you used in - to the model's class name, with an underscore between them.

 <https://docs.djangoproject.com/en/4.0/ref/models/options/>

using some meta class (inner class) functionalities in our code

```
~/Desktop/Projects/Django projects/p1/home/models.py (Django projects) - Sublime Text (UNREGISTERED)
File Edit Selection Find View Goto Tools Project Preferences Help

1 from django.db import models
2
3 # Create your models here.
4
5 class Fruits(models.Model):
6     fruit_name = models.CharField(max_length=100)
7     price = models.IntegerField()
8     manufacturing_date = models.DateField()
9     fruit_description = models.TextField()
10    is_fresh = models.BooleanField(default=True)
11
12
13    def __str__(self) -> str:
14        return self.fruit_name + ' Expiry:' + str(self.manufacturing_date)
15
16
17    class Meta:
18        db_table = 'home_fruits'
19        ordering = ['-fruit_name']
20        unique_together = [['fruit_name', 'price']]
```

So to make this changes in our db we need to make migrations again

```
harsh@harsh-vivobook: ~/Desktop/Projects/Django projects/...
harsh@harsh-vivobook: ~/Desktop/Pr... x harsh@harsh-vivobook: ~/Desktop/Pr... x
ge.py make migrations
Unknown command: 'make'
Type 'manage.py help' for usage.
(jango1) harsh@harsh-vivobook:~/Desktop/Projects/Django projects/p1$ python mana
ge.py makenigrations
Migrations for 'home':
  home/migrations/0002_delete_fruits.py
    - Delete model Fruits
(jango1) harsh@harsh-vivobook:~/Desktop/Projects/Django projects/p1$ python mana
ge.py makenigrations
Migrations for 'home':
  home/migrations/0002_alter_fruits_options_alter_fruits_unique_together_and_mor
e.py
    - Change Meta options on fruits
    - Alter unique_together for fruits (1 constraint(s))
    - Rename table for fruits to home_fruits
(jango1) harsh@harsh-vivobook:~/Desktop/Projects/Django projects/p1$ python mana
ge.py migrate
Operations to perform:
  Apply all migrations: admin, auth, contenttypes, home, sessions
Running migrations:
  Applying home.0002_alter_fruits_options_alter_fruits_unique_together_and_more.
.. OK
(jango1) harsh@harsh-vivobook:~/Desktop/Projects/Django projects/p1$
```

If we want to keep some table default as none
we need to pass null=True and blank=True

Creating and fetching the data from the tables using ORM

- fetching the data from the db
- creating a new entry inside the table

```
python manage.py shell

>>> from home.models import *

>>> Fruits.objects.create(fruit_name='stawberry',price=344,manufacturing_date='2022-01-0
5', fruit_description='lol')
<Fruits: stawberry Expiry:2022-01-05>

>>> Fruits.objects.all()
<QuerySet [<Fruits: stawberry Expiry:2022-01-05>, <Fruits: peach Expiry:2022-08-06>, <Fr
```

```
uits: papaya Expiry:2022-08-06>, <Fruits: carrot Expiry:2022-08-06>, <Fruits: Apple Expiry:2022-08-06>]>
```

Another way of creating a new item inside the db

```
>>> obj = Fruits(fruit_name='stawberry',price=344,manufacturing_date='2022-01-05', fruit_description='lol')
>>> obj = Fruits(fruit_name='pineapple',price=344,manufacturing_date='2022-01-05')
>>> obj.save()

>>> Fruits.objects.all()
<QuerySet [<Fruits: stawberry Expiry:2022-01-05>, <Fruits: pineapple Expiry:2022-01-05>, <Fruits: peach Expiry:2022-08-06>, <Fruits: papaya Expiry:2022-08-06>, <Fruits: carrot Expiry:2022-08-06>, <Fruits: Apple Expiry:2022-08-06>]>
>>>
```

Filtering the data from the db

```
>>> Fruits.objects.filter(fruit_name = "peach")
<QuerySet [<Fruits: peach Expiry:2022-08-06>]>

>>> objs = Fruits.objects.filter(fruit_name='peach')
>>> objs
<QuerySet [<Fruits: peach Expiry:2022-08-06>]>
>>> objs[0]
<Fruits: peach Expiry:2022-08-06>
```

```
(jango1) harsh@harsh-vivobook:~/Desktop/Projects/Django projects/p1$ python manage.py shell
```

```
>>> from home.models import *
>>> obj = Fruits.objects.all()
>>> obj
